

What Do Solar Winds Have To Do With Life On Mars?

The concept that there is life on other planets and in other galaxies is widely popular. It is the core idea of countless science fiction novels. Many television shows, including the classic Star Trek series, and major movies have been spawned by this concept. Some blockbuster movies that come to mind include Close Encounters of the Third Kind, 1977; Star Wars, 1977; E.T. The Extra-Terrestrial, 1982; Independence Day, 1996; and Signs, 2002. Moviegoers find such film-fare fascinating. They want to believe that life on other planets and in other galaxies is possible. Secular Humanists are major proponents of Darwinian-style evolution. They claim that life will be found on other planets and the United States government is spending billions of taxpayer dollars searching for life from outer space. However, having discovered the complete impossibility of life having begun spontaneously from non-living matter here on earth, and completely closed to the fact that life might have been created by God just as the Holy Bible claims it was, they are simply sending their problem to where no one other than their own institutions can conduct the observations. Thus the world will be subject to their interpretations of whatever they find. This is not how real science functions. Consider the current, aggressive search for life on Mars, for example. Here is where those solar winds come into play. It is an observed scientific fact that micro-organisms from earth waft up on wind currents. These have been found in the earth's upper atmosphere and are assumed to get pushed out into space by the solar winds emanating from the sun. These solar winds push things away from the sun and since Mars is further out than the earth the theory is that whenever the microbes get within range of Mars' gravitational pull, they will be brought down onto the surface of the planet. This is what NASA's search for life on Mars is truly all about. The Secular Humanist crowd, devoid of any real scientific evidence in support of "from-goo-to-you" Darwinian-style evolution on our planet, hope to recover some of these earth-born microbes from the surface of the Red Planet. Then headlines around the world will scream, LIFE EVOLVED ON MARS!!! Keep this in mind, because if it happens as I suspect that it one day will, the discovery will be used to mislead billions of people. Should this event occur, the proof that the microbes came from earth will be that they will be just like the microbes we find here today. Should this deceptive event take place it may turn out to be one of the greatest frauds perpetrated against mankind in the history of the world.
